

Slate Web Editor v1.28 Release Notes

New widgets

- Momentary Button widget in Boolean category – Sends a specified value to a bound register when clicked and a value when released
- Universal Switch Button widget – Sends a specified value to a bound register similar to the momentary button however the value sent is for the time specified at design time rather than how long the user clicks on the command button. In addition the user can specify a label when pressed in addition to the default label.
- Select Command widget in Boolean category – dropdown list that is bound to a register allowing the user to specify the text for the numeric commands.
- Radio Button widget in Boolean category – Bound to a register the radio button would typically be used for 3-5 mutually exclusive options. If more than 5 the **Select Command** widget would be a better option.
- Checkbox widget in Boolean category – Bound to a register and would typically be used for presenting 2 choices to a user.
- Background widget in Media section allows user to specify a background color that will adjust with changes in the size of the display area
- Restrict Pane widget – Allows the user to password protect input widgets using the Base local password.

Updated properties to existing widgets

- Added limits for Numeric Input widget and the interval to increment/decrement
- Added border styling for input/output widgets
- Added tooltip attribute for most widgets
- Added color properties for input and output widgets
- Added styling properties for pane widgets
- Added horizontal and vertical spacing feature for a space between widgets
- Aligning of widgets is now based on first selected widget
- Optional auto-scale for all display sizes
